Sometimes we have this problem:

1. renv::init()
2. install.packages("blah")/ renv::install("blah") -> YOU GET AN ERROR HERE BECAUSE IT CAN"T INSTALL THE PACKAGE HERE!

SO you should try:
1. renv::deactivate()
2. install.packages("blah")
3. renv::activate()
4. install.packages("blah")

SOLUTION! only renv::init() when you are finished your project!

You don't need to have any renv-related code in your project. Only the renv.lock file and renv.lock folder that are created when you run renv::init()

Then on MY computer I'll run renv::restore() to install all the packages you used.
